

SOFTWARE ENGINEERING

CSE 470 – Refactoring Code Smells

BRAC UNIVERSITY

Inspiring Excellence

What is Refactoring?

☑ A series of **small** steps, each of which changes the program's **internal structure** without changing its **external behavior** - Martin Fowler

- ☑
 - ☑ Verify no change in external behavior by
 - ☑ Testing
 - ☑ Using the right tool - IDE
 - ☑ Formal code analysis by tool
 - Being very, very careful

What if you hear...

☒ We'll just refactor the code to support logging

☒ Can you refactor the code so that it authenticates against LDAP instead of Database?

☒ We have too much duplicate code, we need to refactor the code to eliminate duplication

☒ This class is too big, we need to refactor it

☒ Caching?

Why do we Refactor?

- ☑ Helps us deliver **more business value faster**
- ☑ Improves the **design** of our software
 - ☑ Minimizes *technical debt*
 - ☑ Keep **development** at *speed*
 - ☑ To make the software easier to **understand**
 - ☑ Write for people, not the compiler
 - ☑ To help find **bugs**

Readability

Which code segment is easier to read?

Sample 1

```
if (date.Before(Summer_Start) || date.After(Summer_End)){  
    charge = quantity * winterRate + winterServiceCharge;  
else  
    charge = quantity * summerRate;  
}
```

Sample 2

```
if (IsSummer(date)) {  
    charge = SummerCharge(quantity);  
else  
    charge = WinterCharge(quantity);  
}
```

When should you refactor?

- ☑ To add **new functionality**

- ☑ refactor existing code until you understand it
- ☑ refactor the design to make it simple to add

- ☑ To find **bugs**

- ☑ refactor to understand the code

- ☑ For **code reviews**

- ☑ immediate effect of code review
- ☑ allows for higher level suggestions

The Two Hats

Adding Function

- ☒ Add new capabilities to the system
- ☒ Adds new tests
- ☒ Get the test working

Refactoring

- ☒ Does not add any new features
- ☒ Does not add tests (but may change some)
- ☒ Restructure the code to remove redundancy

How do we Refactor?

- ☑ We look for **Code-Smells**
- ☑ Things that we suspect are not quite right or will cause us severe pain if we do not fix

2 Piece of Advice before Refactoring

Baby Steps

The Hippocratic Oath

First Do No Harm!

Code Smells?

Code Smells identify *frequently* occurring **design problems** in a way that is more *specific or targeted* than general design guidelines (like “loosely coupled code” or “duplication-free code”). - Joshua K

A code smell is a design that duplicates, complicates, bloats or tightly couples code

A short history of Code Smells

- ☑ If it stinks, change it!
- ☑ Kent Beck coined the term code smell to signify something in code that needed to be changed.

Common Code Smells

- ☒ Inappropriate Naming
- ☒ Comments
- ☒ Dead Code
- ☒ Duplicated code
- ☒ Primitive Obsession
- ☒ Large Class
- ☒ Lazy Class
- ☒ Alternative Class with Different Interface
- ☒ Long Method
- ☒ Long Parameter List
- ☒ Switch Statements
- ☒ Speculative Generality
- ☒ Oddball Solution
- ☒ Feature Envy
- ☒ Refused Bequest
- ☒ Black Sheep

Code Smell - Inappropriate Naming

- ☑ Names given to variables (fields) and methods should be clear and meaningful.
- ☑ A variable name should say exactly what it is.
 - ☑ Which is better?
 - ☑ `private string s;` OR `private string salary;`
- ☑ A method should say exactly what it does.
 - ☑ Which is better?
 - ☑ `public double calc (double s)`
 - ☑ `public double calculateFederalTaxes (double salary)`

Code Smell - Comments

- ☑ Comments are often used as deodorant
- ☑ Comments represent a *failure to express an idea in the code*. Try to make your code self-documenting or intention-revealing
- ☑ When you feel like writing a comment, first try "to refactor so that the comment becomes superfluous"
- ☑ **Remedies:**
 - ☑ Extract Method
 - ☑ Rename Method
 - ☑ Introduce Assertion

Comment: “Grow the Array” smells

```
public class MyList
{
    int INITIAL_CAPACITY = 10;
    bool m_readOnly;
    int m_size = 0;
    int m_capacity;
    string[] m_elements;

    public MyList()
    {
        m_elements = new string[INITIAL_CAPACITY];
        m_capacity = INITIAL_CAPACITY;
    }

    int GetCapacity() {
        return m_capacity;
    }
}
```

```
void AddToList(string element)
{
    if (!m_readOnly)
    {
        int newSize = m_size + 1;
        if (newSize > GetCapacity())
        {
            // grow the array
            m_capacity += INITIAL_CAPACITY;
            string[] elements2 = new string[m_capacity];
            for (int i = 0; i < m_size; i++)
                elements2[i] = m_elements[i];

            m_elements = elements2;
        }
        m_elements[m_size++] = element;
    }
}
```

Comment Smells Make-over

```
void AddToList(string element)
{
    if (m_readOnly)
        return;
    if (ShouldGrow())
    {
        Grow();
    }
    StoreElement(element);
}
```

```
private void Grow()
{
    m_capacity += INITIAL_CAPACITY;
    string[] elements2 = new string[m_capacity];
    for (int i = 0; i < m_size; i++)
        elements2[i] = m_elements[i];

    m_elements = elements2;
}
```

```
private void StoreElement(string element)
{
    m_elements[m_size++] = element;
}
```

```
private bool ShouldGrow()
{
    return (m_size + 1) > GetCapacity();
}
```

Rename Method

Extract Method

```
void PrintOwning(double amount){  
    PrintBanner();  
  
    // print details  
    System.Console.Out.WriteLine("name: "+ name);  
    System.Console.Out.WriteLine("amount: "+ amount);  
}
```

Extract Method

```
void PrintOwning(double amount){  
    PrintBanner();
```

```
    // print details
```

```
    System.Console.Out.WriteLine("name: "+ name);  
    System.Console.Out.WriteLine("amount: "+ amount);
```

```
}
```

```
void PrintOwning(double amount){  
    PrintBanner();  
    PrintDetails(amount);  
}
```

```
void PrintDetails(double amount){  
    System.Console.Out.WriteLine("name: "+ name);  
    System.Console.Out.WriteLine("amount: "+ amount);  
}
```

Introduce Assertion

Introduce Assertion

```
double getExpenseLimit() {  
    // should have either expense limit or a primary project  
    return (_expenseLimit != NULL_EXPENSE) ? _expenseLimit :  
        _primaryProject.GetMemberExpenseLimit();  
}
```

Introduce Assertion

```
double getExpenseLimit() {  
    // should have either expense limit or a primary project  
    return (_expenseLimit != NULL_EXPENSE) ? _expenseLimit :  
        _primaryProject.GetMemberExpenseLimit();  
}
```

```
double getExpenseLimit() {  
    Assert(_expenseLimit != NULL_EXPENSE || _primaryProject != null,  
        "Both Expense Limit and Primary Project must not be null");  
  
    return (_expenseLimit != NULL_EXPENSE) ? _expenseLimit :  
        _primaryProject.GetMemberExpenseLimit();  
}
```

Code Smell - Long Method

- ☑ A method is long when it is too hard to quickly comprehend.
- ☑ Long methods tend to hide behavior that ought to be shared, which leads to duplicated code in other methods or classes.
- ☑ Good OO code is easiest to understand and maintain with shorter methods with good names
- ☑ **Remedies:**
 - ☑ Extract Method
 - ☑ Replace Temp with Query
 - ☑ Introduce Parameter Object
 - ☑ Preserve Whole Object
 - ☑ Decompose Conditional

Long Method Example

```
private String toStringHelper(StringBuffer result)
{
    result.append("<");
    result.append(name);
    result.append(attributes.toString());
    result.append(">");
    if (!value.equals(""))
        result.append(value);
    Iterator it = children().iterator();
    while (it.hasNext())
    {
        TagNode node = (TagNode)it.next();
        node.toStringHelper(result);
    }
    result.append("</");
    result.append(name);
    result.append(">");
    return result.toString();
}
```

Example Html tag:

<name> Jannet Jhonson </name>

Long Method Makeover (Extract Method)

```
private String toStringHelper(StringBuffer result)
{
    writeOpenTagTo(result);
    writeValueTo(result);
    writeChildrenTo(result);
    writeEndTagTo(result);
    return result.toString();
}
```

```
private void writeOpenTagTo(StringBuffer result)
{
    result.append("<");
    result.append(name);
    result.append(attributes.toString());
    result.append(">");
}
```

```
private void writeEndTagTo(StringBuffer result)
{
    result.append("</");
    result.append(name);
    result.append(">");
}
```

```
private void writeValueTo(StringBuffer result)
{
    if (!value.equals(""))
        result.append(value);
}
```

```
private void writeChildrenTo(StringBuffer result)
{
    Iterator it = children().iterator();
    while (it.hasNext())
    {
        TagNode node = (TagNode)it.next();
        node.toStringHelper(result);
    }
}
```

Replace Temp with Query

```
Method1(){  
    double basePrice = _quantity * _itemPrice;  
    if(basePrice > 1000) {  
        return basePrice * 0.95  
    }  
    else{  
        return basePrice*0.98  
    }  
}  
  
Method2(){  
    double basePrice = _quantity * _itemPrice;  
    return basePrice + 100;  
}
```

What if the basePrice calculation equation changes ??

-- We would need to change two lines in the code

Replace Temp with Query

```
Method1(){  
    double basePrice = _quantity * _itemPrice;  
    if(basePrice > 1000) {  
        return basePrice * 0.95  
    }  
    else{  
        return basePrice*0.98  
    }  
}
```

```
Method1(){  
    if(getBasePrice() > 1000) {  
        return getBasePrice() * 0.95;  
    }  
    else {  
        return getBasePrice() * 0.98;  
    }  
}  
  
double getBasePrice() {  
    return _quantity * itemPrice;  
}
```

Replace Temp with Query

```
Method2(){  
    double basePrice = _quantity * _itemPrice;  
    return basePrice + 100;  
}
```

```
double getBasePrice() {  
    return _quantity * itemPrice;  
}
```

```
Method2(){  
    return getBasePrice() + 100;  
}
```

Introduce Parameter Object

```
int MethodTooManyParameter (Date start, Date end, int value, string  
                             month, string yearStart, string yearEnd)  
{  
    // method body  
}
```

Introduce Parameter Object

```
Class DateRange{  
    Date start;  
    Date end;  
}
```

Preserve Whole Object

```
int low = daysTempRange().getLow();  
int high = daysTempRange().getHigh();  
withinPlan = plan.withinRange(low, high);
```

```
daysTempRange(){  
    return someObject;  
}
```

Preserve Whole Object

```
int low = daysTempRange().getLow();  
int high = daysTempRange().getHigh();  
withinPlan = plan.withinRange(low, high);
```

```
withinPlan = plan.withinRange(daysTempRange());
```

Decompose Conditional

You have a complicated conditional (if-then-else) statement.

Extract methods from the condition, then part, and else parts.

```
if (date.before (SUMMER_START) || date.after(SUMMER_END))
```

```
    charge = quantity * _winterRate + _winterServiceCharge;
```

```
else charge = quantity * _summerRate;
```

```
if (notSummer(date))
```

```
    charge = winterCharge(quantity);
```

```
else charge = summerCharge (quantity);
```

Example of Conditional Complexity

```
public bool ProvideCoffee(CoffeeType coffeeType)
{
    if(_change < _CUP_PRICE || !AreCupsSufficient || !IsHotWaterSufficient || !IsCoffeePowderSufficient)
    {
        return false;
    }
    if((coffeeType == CoffeeType.Cream || coffeeType == CoffeeType.CreamAndSugar) && !IsCreamPowderSufficient)
    {
        return false;
    }
    if((coffeeType == CoffeeType.Sugar || coffeeType == CoffeeType.CreamAndSugar) && !IsSugarSufficient)
    {
        return false;
    }

    _cups--;
    _hotWater -= _CUP_HOT_WATER;
    _coffeePowder -= _CUP_COFFEE_POWDER;
    if(coffeeType == CoffeeType.Cream || coffeeType == CoffeeType.CreamAndSugar)
    {
        _creamPowder -= _CUP_CREAM_POWDER;
    }
    if(coffeeType == CoffeeType.Sugar || coffeeType == CoffeeType.CreamAndSugar)
    {
        _sugar -= _CUP_SUGAR;
    }

    ReturnChange();
    return true;
}
```

Code Smell- Long Parameter List

- ☑ Methods that take too many parameters produce client code that is awkward and difficult to work with.

- ☑ **Remedies:**

- ☑ Introduce Parameter Object
- ☑ Replace Parameter with Method
- ☑ Preserve Whole Object

Example

```
private void createUserInGroup() {  
    GroupManager groupManager = new GroupManager();  
    Group group = groupManager.create(TEST_GROUP, false,  
        GroupProfile.UNLIMITED_LICENSES, "",  
        GroupProfile.ONE_YEAR, null);  
    user = userManager.create(USER_NAME, group, USER_NAME, "jack",  
        USER_NAME, LANGUAGE, false, false, new Date(),  
        "blah", new Date());  
}
```

Introduce Parameter Object

Customer

AmoutInvoicedIn(Date start, Date end)

AmoutRecivedIn(Date start, Date end)

AmoutOverdueIn(Date start, Date end)

Introduce Parameter Object

Customer

AmoutInvoicedIn(Date start, Date end)
AmoutRecivedIn(Date start, Date end)
AmoutOverdueIn(Date start, Date end)

Customer

AmoutInvoicedIn(DateRange range)
AmoutRecivedIn(DateRange range)
AmoutOverdueIn(DateRange range)

Replace Parameter with Method

```
public double getPrice() {  
    int basePrice = _quantity * _itemPrice;  
    int discountLevel;  
    if (_quantity > 100)  
        discountLevel = 2;  
    else  
        discountLevel = 1;  
    double finalPrice = discountedPrice (basePrice, discountLevel);  
    return finalPrice;  
}
```

```
private double discountedPrice (int basePrice, int discountLevel) {  
    if (discountLevel == 2)  
        return basePrice * 0.1;  
    else  
        return basePrice * 0.05;  
}
```

Replace Parameter with Method

```
public double getPrice() {  
    int basePrice = _quantity * _itemPrice;  
    int discountLevel = getDiscountLevel();  
    double finalPrice = discountedPrice (basePrice, discountLevel);  
    return finalPrice;  
}  
  
private int getDiscountLevel() {  
    if (_quantity > 100) return 2;  
    else return 1;  
}  
  
private double discountedPrice (int basePrice, int discountLevel) {  
    if (getDiscountLevel() == 2) return basePrice * 0.1;  
    else return basePrice * 0.05;  
}
```

Replace Parameter with Method

```
public double getPrice() {  
    int basePrice = _quantity * _itemPrice;  
    int discountLevel = getDiscountLevel();  
    double finalPrice = discountedPrice (basePrice);  
    return finalPrice;  
}
```

```
private double discountedPrice (int basePrice) {  
    if (getDiscountLevel() == 2) return basePrice * 0.1;  
    else return basePrice * 0.05;  
}
```

Preserve Whole Object

```
int low = daysTempRange().getLow();  
int high = daysTempRange().getHigh();  
withinPlan = plan.withinRange(low, high);
```

Preserve Whole Object

```
int low = daysTempRange().getLow();  
int high = daysTempRange().getHigh();  
withinPlan = plan.withinRange(low, high);
```

```
withinPlan = plan.withinRange(daysTempRange());
```

Feature Envy

- ☑ A method that seems more interested in some other class than the one it is in.
- ☑ Data and behavior that acts on that data belong together. When a method makes too many calls to other classes to obtain data or functionality, Feature Envy is in the air.

- ☑ **Remedies:**

- ☑ Move Field
- ☑ Move Method
- ☑ Extract Method

Example

```
Public class CapitalStrategy{
    double capital(Loan loan)
    {
        if (loan.getExpiry() == NO_DATE && loan.getMaturity() != NO_DATE)
            return loan.getCommitmentAmount() * loan.duration() * loan.riskFactor();

        if (loan.getExpiry() != NO_DATE && loan.getMaturity() == NO_DATE)
        {
            if (loan.getUnusedPercentage() != 1.0)
                return loan.getCommitmentAmount() * loan.getUnusedPercentage() *
loan.duration() * loan.riskFactor();
            else
                return (loan.outstandingRiskAmount() * loan.duration() * loan.riskFactor()) +
                    (loan.unusedRiskAmount() * loan.duration() * loan.unusedRiskFactor());
        }

        return 0.0;
    }
}
```

Move Field

Move Method

Duplicated Code

- ☑ The *most pervasive and pungent smell* in software

- ☑ There is obvious or blatant duplication

 - ☑ Such as copy and paste

- ☑ There are subtle or non-obvious duplications

 - Similar algorithms

Remedies

- ☑ Extract Method

- ☑ Pull Up Field

- ☑ Form Template Method

 - Substitute Algorithm

Ctl+C Ctl+V Pattern

```
public static MailTemplate getStaticTemplate(Languages language) {
    MailTemplate mailTemplate = null;
    if(language.equals(Languages.English)) {
        mailTemplate = new EnglishLanguageTemplate();
    } else if(language.equals(Languages.French)) {
        mailTemplate = new FrenchLanguageTemplate();
    } else if(language.equals(Languages.Chinese)) {
        mailTemplate = new ChineseLanguageTemplate();
    } else {
        throw new IllegalArgumentException("Invalid language type specified");
    }
    return mailTemplate;
}

public static MailTemplate getDynamicTemplate(Languages language, String content) {
    MailTemplate mailTemplate = null;
    if(language.equals(Languages.English)) {
        mailTemplate = new EnglishLanguageTemplate(content);
    } else if(language.equals(Languages.French)) {
        mailTemplate = new FrenchLanguageTemplate(content);
    } else if(language.equals(Languages.Chinese)) {
        mailTemplate = new ChineseLanguageTemplate(content);
    } else {
        throw new IllegalArgumentException("Invalid language type spec...");
    }
    return mailTemplate;
}
```

Example Of Obvious Duplication

```

private void AddOrderMaterials(int iOrderId)
{

    if (iOrderType == 1)
    {
        OrderMaterial oOrderMaterialCoffee = new OrderMaterial();
        oOrderMaterialCoffee.MaterialId = 1;
        oOrderMaterialCoffee.OrderId = iOrderId;
        oOrderMaterialCoffee.Quantity = 2;
        oDataContext.OrderMaterials.Inserton<x>submit(oOrderMaterialCoffee);

        oDataContext.SubmitChanges();
    }
    else if (iOrderType == 2)
    {
        OrderMaterial oOrderMaterialCoffee = new OrderMaterial();
        oOrderMaterialCoffee.MaterialId = 1;
        oOrderMaterialCoffee.OrderId = iOrderId;
        oOrderMaterialCoffee.Quantity = 2;
        oDataContext.OrderMaterials.Inserton<x>submit(oOrderMaterialCoffee);

        OrderMaterial oOrderMaterialCream = new OrderMaterial();
        oOrderMaterialCream.MaterialId = 2;
        oOrderMaterialCream.OrderId = iOrderId;
        oOrderMaterialCream.Quantity = 2;
        oDataContext.OrderMaterials.Inserton<x>submit(oOrderMaterialCream);

        oDataContext.SubmitChanges();
    }
    else if (iOrderType == 3)
    {
        OrderMaterial oOrderMaterialCoffee = new OrderMaterial();
        oOrderMaterialCoffee.MaterialId = 1;
        oOrderMaterialCoffee.OrderId = iOrderId;
        oOrderMaterialCoffee.Quantity = 2;
        oDataContext.OrderMaterials.Inserton<x>submit(oOrderMaterialCoffee);

        OrderMaterial oOrderMaterialSugar = new OrderMaterial();
        oOrderMaterialSugar.MaterialId = 3;
        oOrderMaterialSugar.OrderId = iOrderId;
        oOrderMaterialSugar.Quantity = 2;
        oDataContext.OrderMaterials.Inserton<x>submit(oOrderMaterialSugar);

        oDataContext.SubmitChanges();
    }
    else if (iOrderType == 4)

```

Levels of Duplication

Literal Duplication

Same for loop in 2 places

Semantic Duplication

```
for(int i : asList(1,3,5,10,15))  
    stack.push(i);
```

v/s

```
for(int i=0;i<5;i++){  
    stack.push(asList(i));  
}
```

1stLevel - For and For Each Loop

2ndLevel - Loop v/s Lines repeated

```
stack.push(1); stack.push(3);  
stack.push(5); stack.push(10);  
stack.push(15);
```

v/s

```
for(int i : asList(1,3,5,10,15))  
    stack.push(i);
```

Data Duplication

Some constant declared in 2 classes (test and production)

Conceptual Duplication

2 Algorithm to Sort elements (Bubble sort and Quick sort)

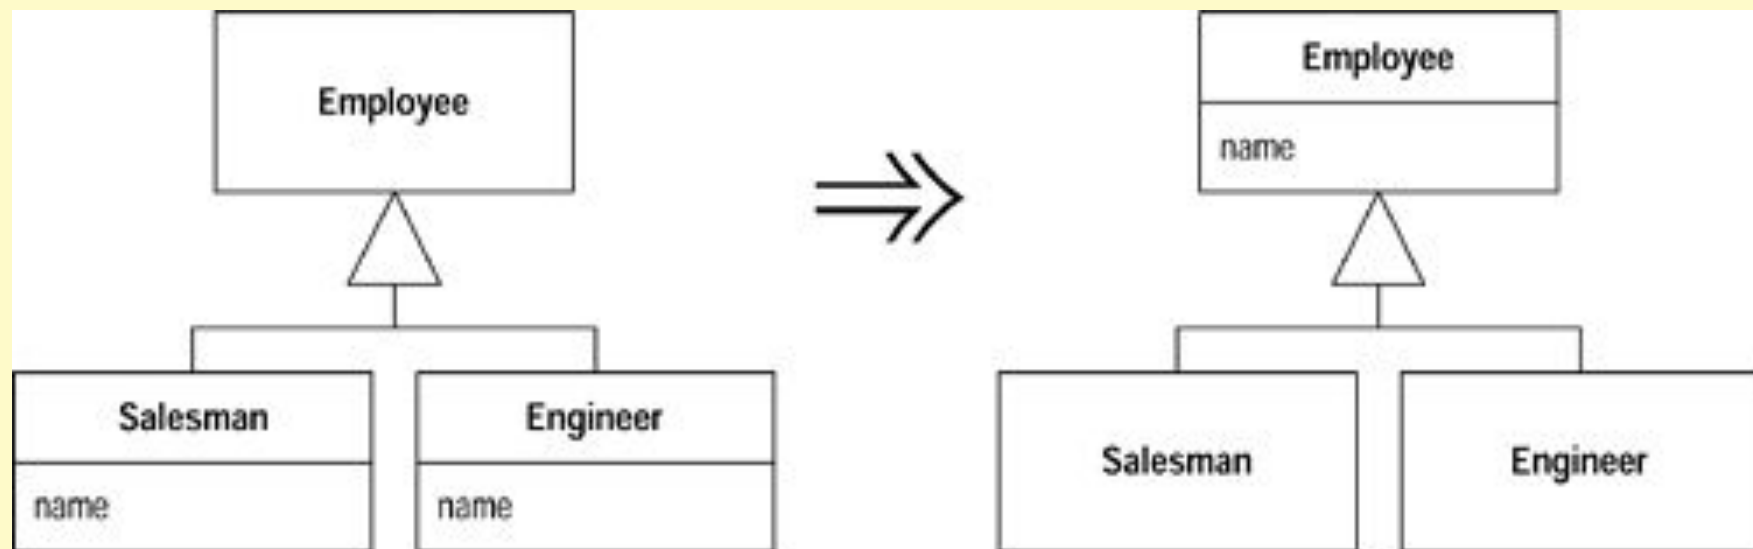

Logical Steps - Duplication

Same set of steps repeat in different scenarios.

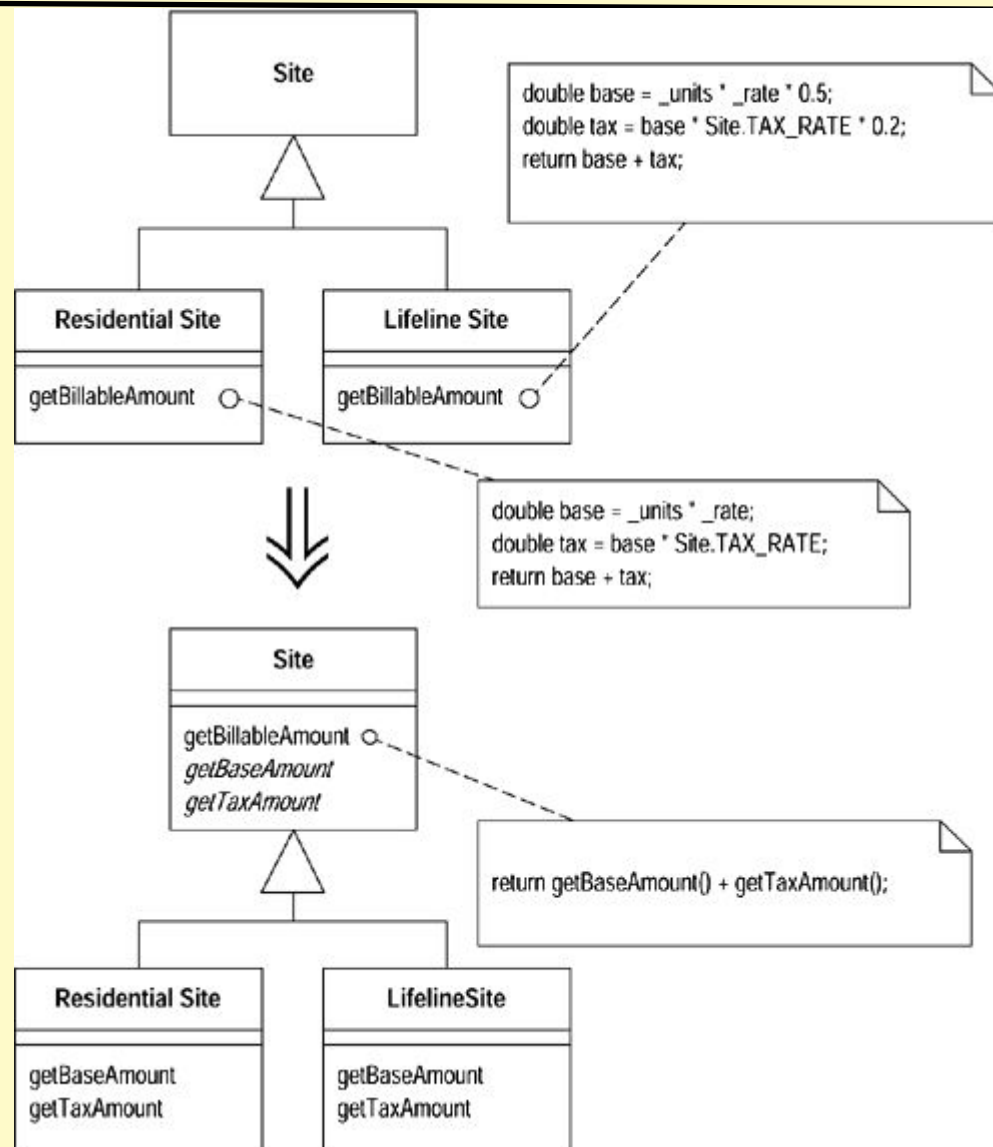

Ex: Same set of validations in various points in your applications

Pull Up Field

Form Template Method

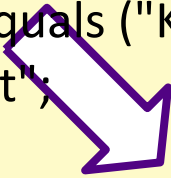

Substitute Algorithm

```
String foundPerson(String[] people){  
for (int i = 0; i < people.length; i++) {  
    if (people[i].equals ("Don")){  
        return "Don";  
    }  
    if (people[i].equals ("John")){  
        return "John";  
    }  
    if (people[i].equals ("Kent")){  
        return "Kent";  
    }  
}  
return ""; }
```

Substitute Algorithm

```
String foundPerson(String[] people){
```

```
    for (int i = 0; i < people.length; i++) {  
        if (people[i].equals ("Don")){  
            return "Don";  
        }  
        if (people[i].equals ("John")){  
            return "John";  
        }  
        if (people[i].equals ("Kent")){  
            return "Kent";  
        }  
    }  
    return "";  
}
```

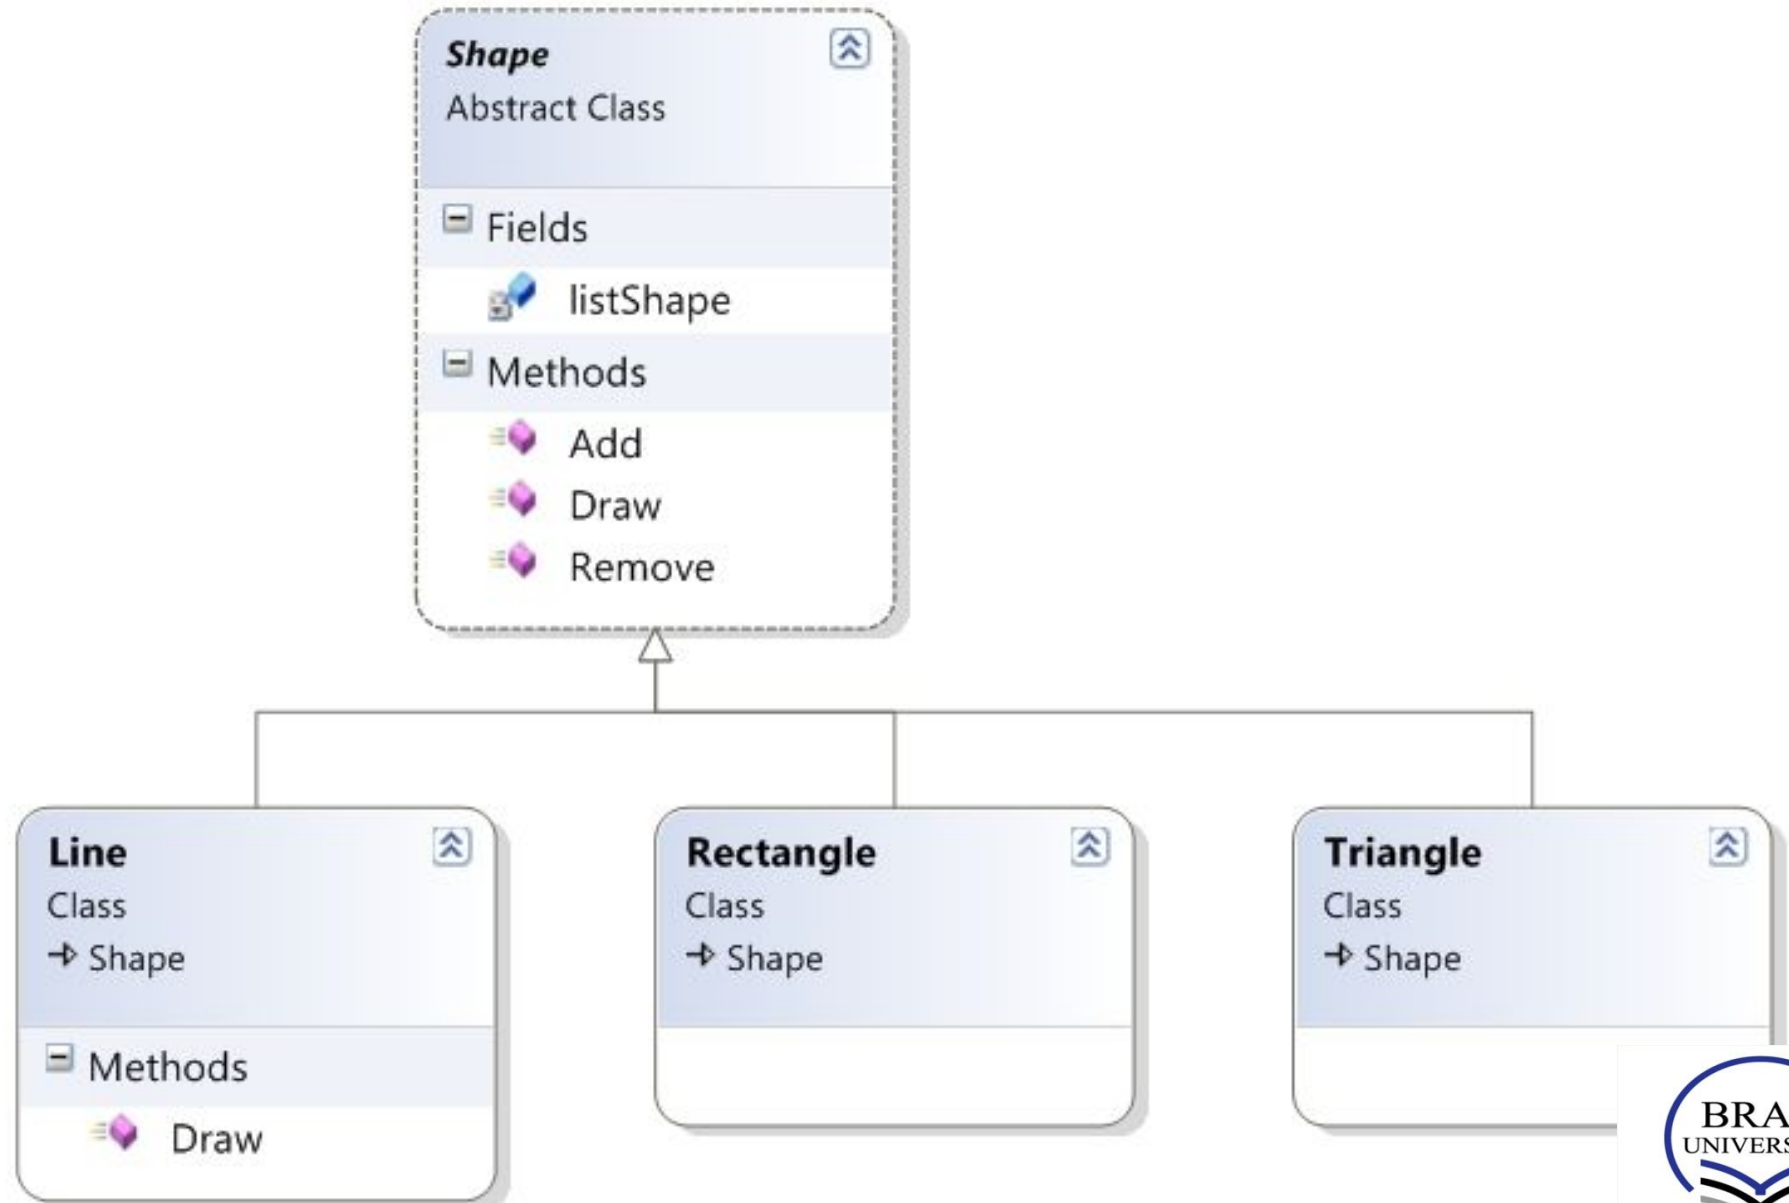

```
String foundPerson(String[] people){  
    List candidates = Arrays.asList(new String[] {"Don",  
    "John", "Kent"});  
    for (String person : people)  
        if (candidates.contains(person))  
            return person;  
    return "";  
}
```

Refused Bequest

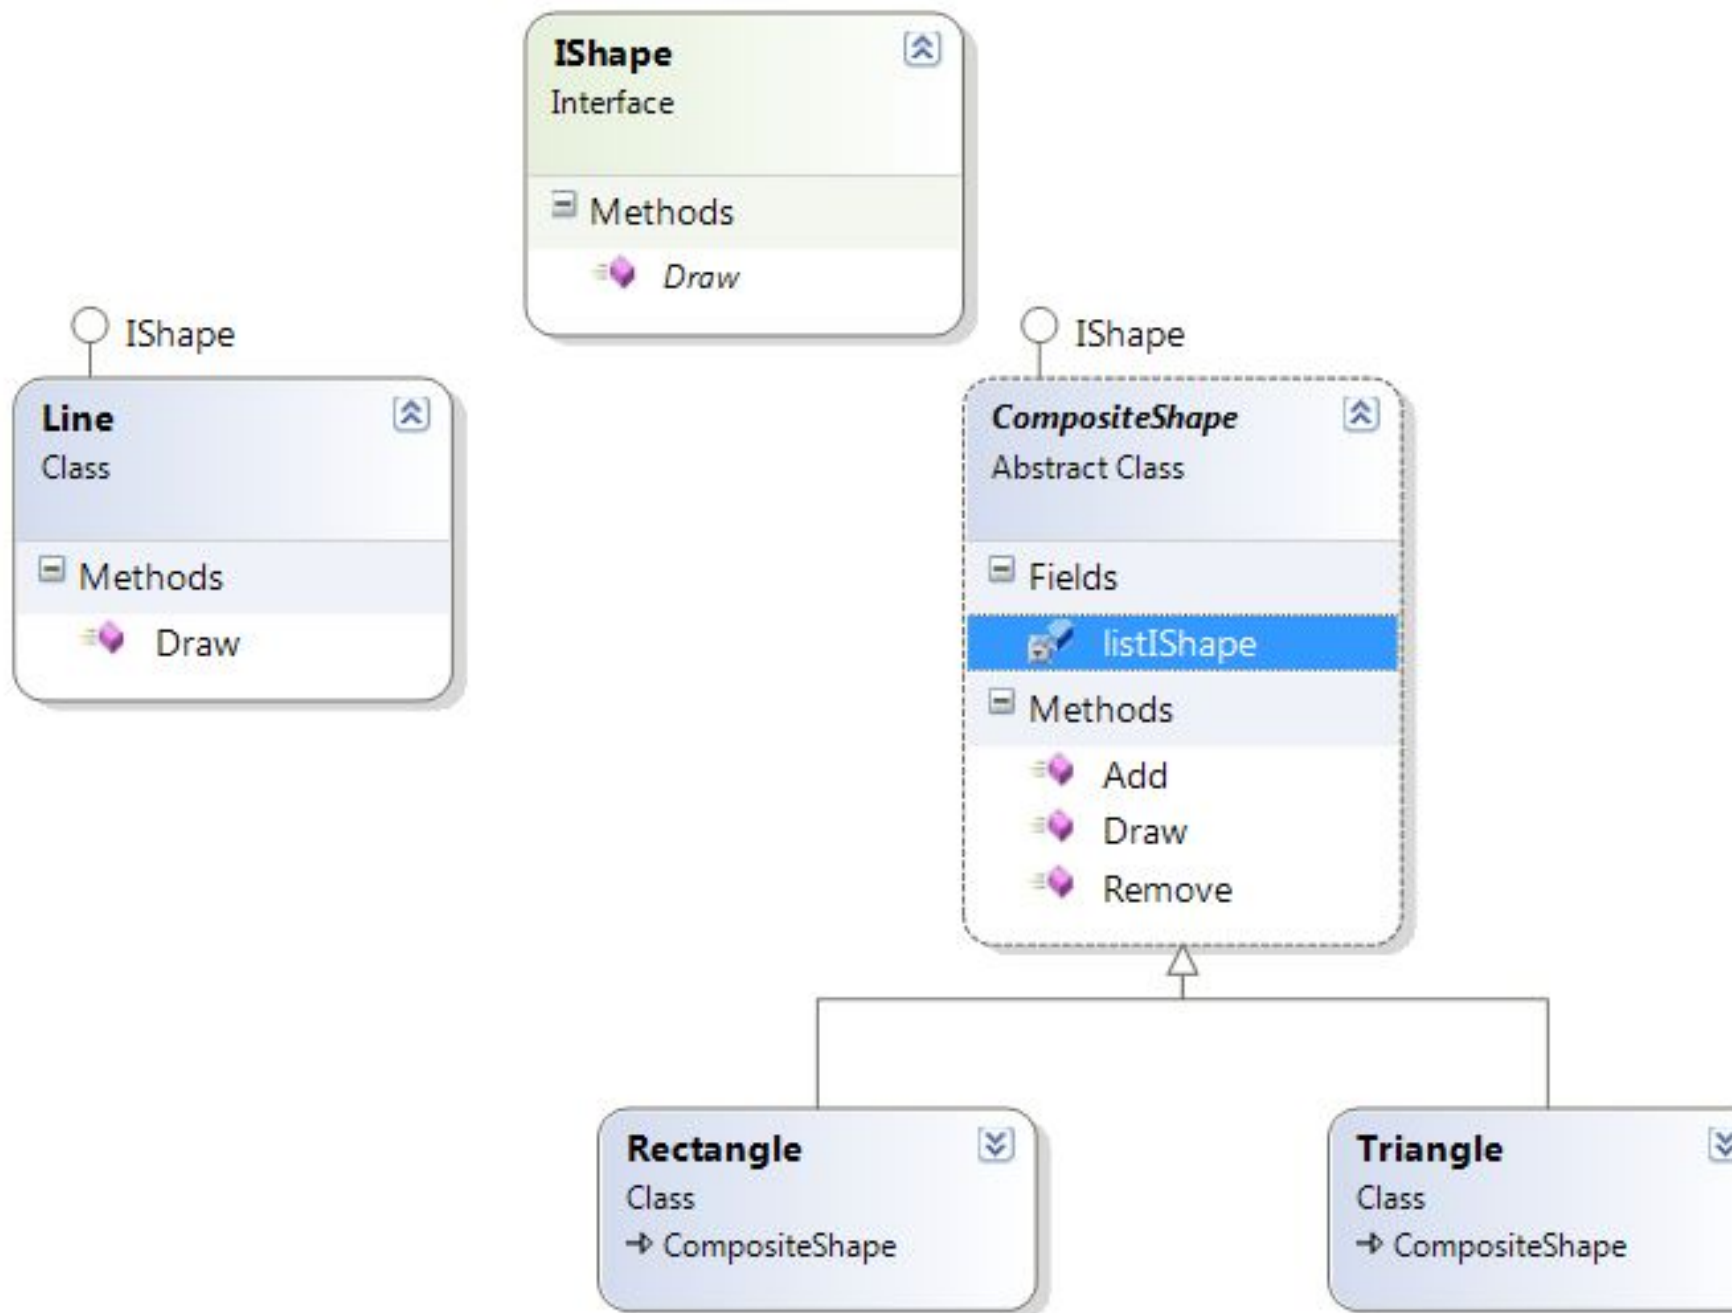

- ☑ This rather potent odor results when *subclasses inherit code that they don't want*. In some cases, a subclass may “refuse the bequest” by providing a *do-nothing implementation* of an inherited method.
- ☑ Remedies
 - ☑ Push Down Field
 - ☑ Push Down Method

Example of Refused Bequest

Refused Bequest Make Over
